Aerolite – is Bio - Safe

Calcium Silicate is synthesis of lime and silica at high temperature and the reaction neutralizes alkalinity of lime.

Calcium Silicate can absorb 100% water without damage to its structural integrity.

Calcium Silicate is also used as soil conditioner to improve retention of water in the plant buds.

This product in the west is extensively used as a "cat-litter" because it will not irritate the cats skin.

Thus Calcium Silicate material is bio-compatible and is demonstrated not to have any adverse effect for animals and plants.

"Aerolite" is made by synthesis of Calcium Silicate and no chemicals are added.
